Its conventional display is by means of a 2D monitor. In order to translate 3DRI for surgical guidance, we developed 3DRI visualizations from full 3D datasets of the retina (total of 52 patient records; N = 330 eyes) that were registered to the

intraoperative operating room (OR) system. The proposed approach, referred to as "Visually-Based Transfer of 3D Retinal Images into the OR," (VBRTIOR) is based on a 3D segmentation of the retina (auto-segmentation) followed by registration of the data to the OR. We observed that the segmentation is of good quality and that registration is of high fidelity. The application of the novel technique was performed in 17 cases (N = 120 eyes). The surgeon and assistant performed a complete operation assisted by 3DRI. Additional surgery based on this technique included: intracorneal segment of Descemet membrane (17.9%, N = 11/60), implantation of a scleral flap
