---

Sourcetrail is a native code explorer and manipulator for C++ and C code. Its aim is to provide fast and extensive code visualization and analysis. Its name comes from the fact that sourcetrail provides code with a sour taste. If you are a programmer and run Microsoft Office, you are probably also familiar with the new Table of Contents tool, included in Microsoft Office 2013 and 2015.

---

While it's certainly a great tool to quickly check if a particular paragraph corresponds to its section, it's probably best suited to large documents, so that you can more easily stay focused on a more detailed analysis. If that's not your case, you might want to switch to a more comprehensive software solution. The Table of Contents is a handily-positioned element in the Microsoft Office interface. With Microsoft Office

---

2010, you were able to add the Table of Contents tool as an extra menu item to the Insert section of the Ribbon; this menu item also included a number of other related functions such as Inserting a new Table of Contents, finding the link from within a table or hiding the Table of Contents altogether. Although the functionality is the same, the default implementation is somewhat different; while

---

Microsoft Office 2013 and later generates new Tables of Contents from within a document, 2010 only displays them from the header. While Microsoft Office 2013 and later always generated a Table of Contents from within a document, Microsoft Office 2010 started doing so on documents that had a Table of Contents that wasn't a part of the Table of Contents in the document

---

header. And even if you didn't have a Table of Contents in the document header, it still generated a new Table of Contents from within.

Fortunately, Table of Contents weren't limited to the header, and if you created a new Document, you could add a Table of Contents using the Table of Contents tool. This means that you could always generate a Table of Contents

---

from the elements within a document, and not just from the header. However, the drawback of the new Table of Contents interface was that the header became a part of the Table of Contents, and the header was quite hard to identify among the other elements. Once you had an item selected, there was no way to remove it from the list because you couldn't simply select the header. Fortunately,

---

Microsoft added the remove Table of Contents button in 2011 and updated the Table of Contents tool in Microsoft Office 2013 and 2015 to make it easy to remove Table of Contents. After the update, even if you add a Table aa67ecbc25
