=====
Torsion of a wandering spleen (WS) is an extremely rare pathology. It is the result of torsion of the mesosigmoid loop of the greater omentum that inserts into the splenic capsule ([@r1]-[@r3]).

This torsion results in blood flow interruption to the spleen and stasis. The omentum performs lymphatic drainage and visceral blood supply in the abdominal cavity, and also contains the majority of the splenic white pulp ([@r3]). Most cases of WS are reported in children, with a mean age of 5-7 years ([@r4]). WS is observed in both sexes, but the slight female predominance in the initial part of life has not been confirmed ([@r2]).

The most common presenting symptom of WS is acute abdominal pain, with or without nausea, vomiting, and anorexia ([@r2]). The diagnosis of WS is based on ultrasonography, computerized tomography (CT), or abdominal magnetic resonance imaging (MRI). Imaging studies reveal the presence of the spleen in a distended epigastric location, with perisplenic effusion and twisted mesenterium ([@r3], [@r5]-[@r7]).

=====
A 17-year-old male patient, presented to our Emergency Unit with a history of severe epigastric pain and tachycardia. Pain was localized in the epigastric area, and was aggravated by palpation, in the last 12 hours. He denied nausea and vomiting, only occasional nausea in the morning. On clinical examination, patient was tachycardic with blood pressure of 110/70 mmHg. Hematologic and biochemical investigations were normal. Abdominal ultrasound examination revealed spleen to be enlarged with loss of normal echogenicity in a distended epigastric location. CT scan showed a massively enlarged spleen, 8.2 cm in diameter, with twisted mesenterium. Spleen contained a large amount of fluid and no discrete
