The efficacy of treatment for inguinal hernia: a systematic review of randomized controlled trials. To determine the efficacy of any type of surgical repair of inguinal hernias, including tension-free repair, tension-free repair with a prosthetic patch, tension-free repair with a prosthetic patch

supplemented with an intraperitoneal polypropylene mesh, placement of hernia prosthesis, and no primary closure.

MEDLINE (1966 to 2001), EMBASE, CINAHL, Dissertation Abstracts

International, Cochrane Controlled Trial Register, and the Science Citation Index were searched for randomized controlled trials of any type of hernia repair.

Inclusion criteria were: clinically and radiologically diagnosed inguinal hernia; at least 20 patients per study; at least 6 months follow-up; surgical repair of hernia as treatment; and lack of preference for one surgical approach over another. Study characteristics, including patient characteristics, type and size of hernia, type of repair, and outcomes, were assessed in duplicate using a standardized form. Outcomes were assessed for all patients, for those who were perioperative non-recipients
